ABSTRACT

"A method of handling a data request"

5   A method of handling a data request by exporting data from at least one database to
at least one receiver via an intermediary server, the intermediary server comprising at
least one database adapter and a memory buffer for temporary storage of data, the
method including the steps of transmitting a data request to the database, retrieving
the data from the database and assigning it with a unique ID, transmitting the data

10   and the unique ID to the intermediary server, passing the data through the database
adapter to transform the data into receiver readable format and transmitting the
transformed data and unique ID number to the receiver when the receiver is next
enabled to receive the data. There is furthermore provided a computer implemented
system for accessing databases operated by independent electronic processing

15   devices.
